I got less done this week than I was hoping for in my plan, but I should have much more time this week to work. Since my last submission, I added a Voice.js class file and structure for polyphony and started working on the keyboard UI. Neither endeavor has been very fruitful, but I will continue to troubleshoot and develop them. My coding for polyphony is correctly functioning to log the key in the console, but I have lost sound since adding it. I believe this is some sort of syntax or chain problem that came up from trying to make the voices a class. I worked with the UI from the CSS tips and tricks website for building a keyboard image, but I haven't gotten the image to appear on the website. This is something I have questions about, but plan to ask about in office hours.
